## The Geophysical Observatory at Neumayer Station, Antarctica

### Geomagnetic and Seismological Observations 1995 and 1996

#### 1. Introduction

The geophysical observatory at the German Antarctic research station "Neumayer" on the Ekström Ice Shelf (Fig. 1) is now operating since 1992. It continues the observatory program carried out at the former "Georg-von-Neumayer Station" (GvN), which started in 1982. The new observatory was completely modernized and most of the electronics was replaced by new instruments representing the latest state of engineering. Especially the digital data acquisition was totally changed and is now based on a network of several UNIX-workstations.

The main tasks of the observatory are still related to seismology and geomagnetism. The "seismic" and the "magnetic" observatory are located about 850 m south of the base to eliminate any disturbances caused by the base itself and its activities. The magnetic observatory is separated again by about 100 m from the seismic observatory. At both sites special laboratory containers are installed inside deep snow caves, initially about 7 meters below the normal surface, to ensure a minimum of wind induced noise and to guarantee stable temperature conditions. The caves are covered by a solid wooden roof which should withstand the weight of several meters of accumulated snow.

Inside the magnetic observatory a stable and thermally well insulated plywood container houses only the flux-gate sensors and the theodolite to measure the field's declination and inclination. Although there is no special temperature control the temperature inside this container is fairly stable at about 0° to +2 °C only by some permanently shining lamps. For data acquisition the output-signals of the flux-gate sensors are transmitted via cable to the seismic observatory. The sensor of the proton precession magnetometers (PPM) for total-field measurements is installed in small wooden shelters buried in the snow some 50 m outside the seismic observatory.

The seismic observatory is the central part of the geophysical observatory and nearly all instruments and devices for data acquisition are installed here. Data acquisition in the seismic observatory is now controlled by a UNIX-workstation. The workstation is connected to the station's main server via a fibre-optical link. So all other workstations in the station's network have access to the observatory's hard disk and thus a continuous on-line monitoring of the data-acquisition is therefore possible inside the station's geophysical laboratory.

Exact time-control of the measurements is accomplished by the station's master-clock, which is controlled by a GPS time-signal receiver. It synchronizes the observatory's slave clock which triggers the ADC and PPM-magnetometers.

Figure 2 shows a comprehensive organogram of the principal configuration of the observatories. Coordinates and some other important data are summarized in the table below.

**Table 1: Coordinates and other relevant data:**

geographic coordinates 1996:	70.66° S 08.26° W
height above sea level:	57 m
mean annual drift:	approx. 150 m/year towards 326°
geomagnetic coordinates:	61.23° S 41.47° W
mean total intensity 1996:	39744 nT
mean declination 1996:	12° 24.8' W
mean inclination 1996:	61° 26.3'

The main purpose of this report is to give a comprehensive view about the geomagnetic and seismological data which had been registered during the years 1995 to 1996.

## 2. Geomagnetic Measurements

The time variations of the NS-, EW- and Z-component of the geomagnetic field are continuously measured with three flux-gate sensors which are integrated into a single sensor-triple. The total intensity  $F$  is measured with a PPM-magnetometer (ELSEC 820). The exact alignment of the system parallel to geographic North was established and is controlled by a gyro-compass. This azimuth-control is done in regular intervals which is also very important for measuring the declination  $D$  and inclination  $I$ . The variations of declination and inclination are shown in Figure 3. A non-magnetic theodolite combined with a single-axis flux gate sensor is used to determine these angular elements. From  $D$ ,  $I$  and the total intensity  $F$  absolute values of the field components are obtained. Since the flux gate measurements are only relative measurements, the determination of the absolute values of the field-components is essential for the computation of absolute base lines. The table below shows the currently used sampling rates concerning the geomagnetic data.

**Table 2: Sampling rates for geomagnetic data:**

EW, NS, Z components:	1 per second
Total intensity $F$ :	1 per minute
$D$ , $I$ measurements:	every 2-3 days (depends on magnetic activity)
gyro-compass control:	monthly

In Appendix A the magnetic field's time variations are shown for every month during the years 1995 and 1996. They clearly illustrate the typical difference between recordings made in austral summer and austral winter: measurements during the summer show small, but pronounced daily variations caused by the seasonal changing SQ-variations (solar quiet variations) which vanish almost completely during the winter.

Hourly absolute mean values of the field's components and the total intensity are processed and arranged in monthly tables according to the recommendations of the International Association of Geomagnetism and Aeronomy (IAGA). The complete set of Neumayer-data from a whole year is mailed to the World Data Center (WDC) immediately after the data have arrived at the AWI. Additionally, due to the satellite based computer link, selected magnetic data of special interest may be available on request within a few days to every interested scientist.

Digital recording of the time variations of the geomagnetic field at GvN and Neumayer has been carried out almost continuously until today since 1983. This basic geomagnetic observatory program will be continued for at least ten more years, until the end of the expected life time of Neumayer station. Until now the available geomagnetic field data from GvN and Neumayer, recorded at the standard interval of one minute, comprise more than twelve years, i.e. almost one complete solar cycle. Continuously complemented with new observatory data this data set thus forms a valuable basis for various aspects in geomagnetic research, for example:

- studying the long term variations of declination, inclination and total intensity as part of the secular variation of the geomagnetic field
- detailed statistical analysis of the field's daily solar and lunar variations, their seasonal dependance and their relation to the state of solar activity
- investigation of special magnetic phenomena related to the polar electrojet
- different aspects in pulsation studies using 1 Hz or even 10 Hz data

### 3. Seismological Observations

Continuous monitoring of the regional and global seismicity started in 1982 and in all these years an enormous amount of seismological data has been collected. Several thousands of digital seismograms have been recorded with a local network of seismological stations around GvN and Neumayer. A large part of these recordings show excellent data quality although most of these network stations are located on a floating ice shelf which is certainly not the most favourable location for seismological observations. More than two third of the recorded events are in the teleseismic range with epicentral distances greater  $25^\circ$  and are well localized by NEIC and ISC. But there are numerous recordings of earthquakes in the regional distance range between approx.  $10^\circ$  and  $20^\circ$ . These earthquakes with epicenters mostly in the Southern Atlantic Ocean, in an area ranging from the Antarctic Peninsula and the Scotia Sea in the West to the East of Bouvet Island, including the seismically very active region around the South Sandwich Islands are only partly localized by the international agencies. The major part of these events however are not localized by NEIC or ISC because their magnitudes were too small to be recorded at some other stations outside Antarctica. Therefore these seismological recordings are very valuable for a detailed mapping of the seismic activity in these regions.

Currently our interests focus on the investigation of the principal structures of the deeper earth below the Ekström Ice Shelf, i.e. the crust and the upper mantle. Different seismological standard processing techniques are applied for this purpose and they all benefit now from the numerous recordings of teleseismic events collected during all these years. The main topics currently are:

- calculating and modelling receiver functions using selected seismograms recorded with seismometers of intermediate eigenperiods.
- analyzing slowness and azimuth anomalies utilizing almost all usable network-data
- continuation of the analysis of teleseismic travel time residuals including more data from other stations in Antarctica
- investigations of seismic anisotropy by investigations on shear wave splitting (SKS-phases and selected S-waves from deep focus earthquakes)

Besides the three Geotech S-13 seismometers in the seismic observatory there are currently six additional remote seismographic stations installed in the wider area around Neumayer station (Fig. 1). This seismographic network, with two stations located quite far away from the base, is operating almost continuously throughout the whole year. Longer lasting break-downs with a duration of up to three months, especially during the winter time due to power-failure, affect only the two most remote stations. These stations, "Watzmann" and "Olymp", are located far to the southeast and southwest and cannot be visited for service during the Antarctic winter. They are situated on the ice rises "Halvfar Ryggen" and "Søråsen", both at approx. 350 m and 500 m above sea level. Because of their special location on grounded ice these two stations are of great importance for the observations of shear-waves. The stations "Watzmann" and "Olymp" are equipped with autonomously running PCM-systems. They are operating in a gain-ranging mode which enables a dynamic range of nearly 120 dB. In the geophysical laboratory the transmitted digital PCM-code is added to the central PCM-mixer-unit, which evaluates also the transmitted trigger-status (see also Fig. 2). Because the locations of these stations are more favourable for seismological research they are equipped with 3-component seismometers with longer eigenperiods of 5 sec or 20 sec (LENNARTZ Le-3D / 5s and MARK L-IV with special designed electronic feedback). The sample rate is 125 Hz and the anti-aliasing low-pass filters are set to a corner frequency of 25 Hz.

All other stations are situated on the floating ice shelf. The remote stations on the ice shelf are equipped with 1 Hz seismometers (LENNARTZ Le-3D / 1s) and only the vertical component is transmitted. The stations are transmitting the amplified signals FM-modulated and therefore the dynamic range is limited to 60 dB. At these stations the observation of S-phases is unfortunately drastically impaired by the water layer beneath the ice shelf.

Because shear-waves cannot penetrate through this water layer, the observation of S-phases is depending on the conversion of the vertically polarized S-wave components into P-waves at the seafloor-ocean interface. Therefore recorded S-phases show strongly decreased amplitudes compared to the two remote stations located on the ice rises. Despite this fact, the instruments in the seismic observatory are the station's main seismometers because they are continuously operating without any interruptions. The signals from all remote stations are transmitted continuously via UHF-telemetry to the station where they are centrally recorded on tape. The recording is triggered by a multichannel STA/LTA event-detector. In the near future it is intended to transfer the incoming data stream of the Neumayer network continuously to a UNIX-workstation and to store all seismic data on a large disk-array.

In the laboratory the recorded events can be transferred via an IEEE-interface to one of the station's workstations for further processing. A variety of software-tools (PITSA, SEISAN) allows almost a complete analysis and processing of the recorded earthquakes (phase picking, beam forming etc.). Furthermore the dial-up computer-link to Bremerhaven enables a fast transfer of complete seismograms of interesting events for current research work at home.

An approximate determination of the hypocenter using only the Neumayer network data will be successful only in some very few cases. But if these data are combined with reordings from other Antarctic stations the errors will be reduced to a reasonable degree. A further approach for more reliable localizations of regional events is the planned installation of a 15-channel small aperture array on the Halfvar Ryggen ice rise southeast of Neumayer in 1997. With this regional monitoring array and special processing techniques a major improvement in the detection capabilities should be achieved. And even more, by comparing array-recordings of selected "master events" and the corresponding localizations with seismograms from the original network not including the array it should be possible to derive more reliable solutions for the hypocenters of many previously recorded events. This will be the next step in the further processing the seismological data from Neumayer.

First arrival times and other phase readings of recorded events are sent to NEIC National Information Earthquake Center) and ISC (International Seismological Center) in a regular (monthly) schedule. Since autumn 1995 there are three stations of Neumayer registered in the station list of NEIC. Their IDs and coordinates are shown in the table below.

**Table 3: Coordinates of the registered Seismological Stations (1996):**

Station ID	Full Name of the station	Latitude	Longitude	Height
VNA1	Neumayer -- Observatory	70.65° S	08.26° W	57 m
VNA2	Neumayer -- Watzmann	70.93° S	07.39° W	395 m
VNA3	Neumayer -- Olymp	71.24° S	09.67° W	525 m

Up to 1995 we reported the phases only for the station's main seismometers (VNA1) Since 1996 we also sent picked events of the two remotest stations VNA2 and VNA3, whenever we got triggered events of them on tape. In this report we'll only show the picked events at Neumayer-Station (VNA1) of the years 1995 and 1996 in Appendix B or C respectively. Each Appendix contains the the list of picked events, the list of corresponding epicentres and some examples of digital records of seismograms. In Appendix D we show some examples of picked events at VNA, which location are not identified by NEIC.

The onset of the teleseismic events were detected on analog, or if present on digital seismograms. The arrival times of P- and S-Phases are summarized in the first list. Arrival time is represented in UTC. Symbols e and i in front of the phases denote emergent and sharp onsets, + denote upward ground motions, - denote downward ground motions. Phases which have a ? are not identified in wave type. That's the matter if the location of the event cannot be identified, or the phase is clear, but cannot be fixed. Events which can

be identified by NEIC-Reports have a serial number in the last column of the line. This serial number corresponds to the number in the list of epicentres following the list of events. Events which are marked with a D in the column of the serial number are available as digital records. The number of recorded events every year is between 400 and 800. For 1995 and 1996 we got a total sum of 1292 events. Figure 4 shows the locations of the epicentres of all recorded events.

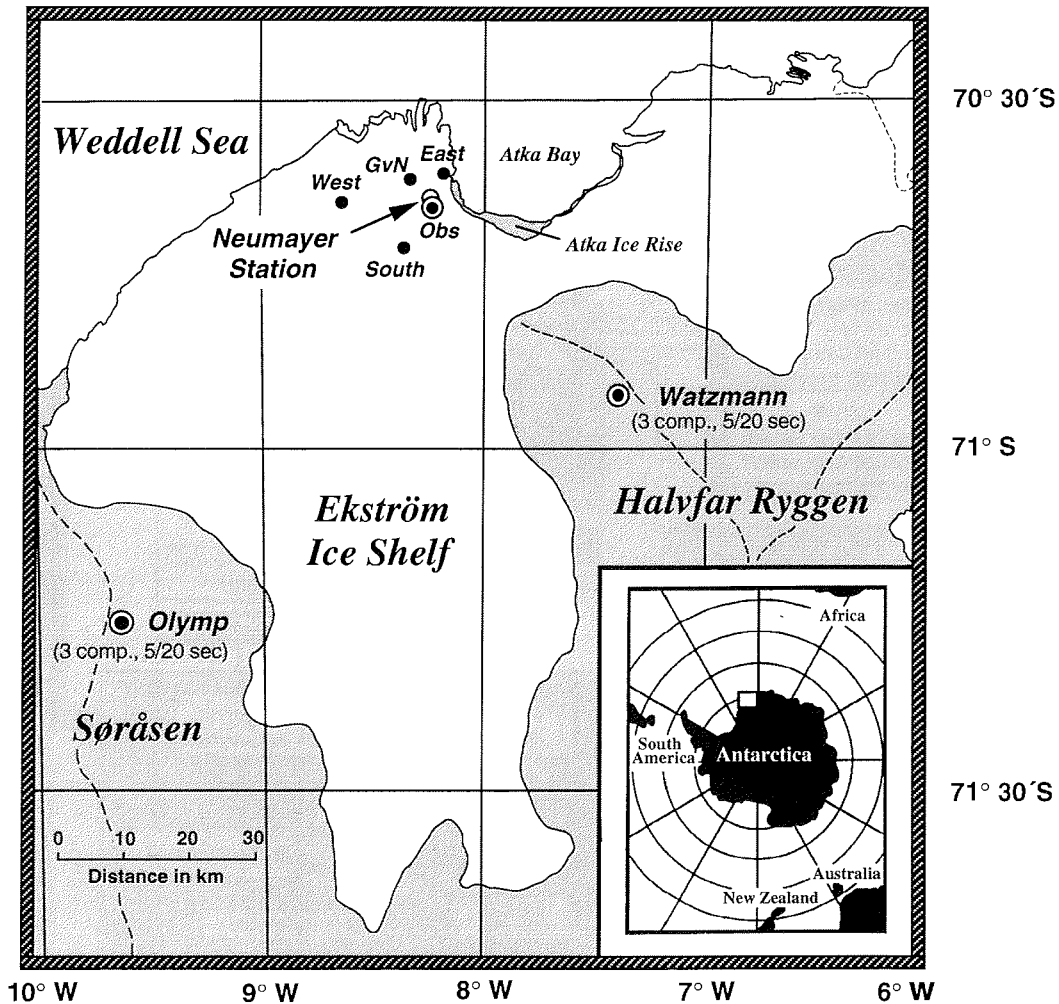

The relationship between the epicentral distance and the magnitude for all events is shown in Figure 5a. The threshold-magnitude for detection of events in the distance range up to  $100^\circ$  is in most cases not higher than  $m_b = 5.0$  depending on the distance, the actual wind conditions and the related ground noise, the network's position relative to the nodal planes etc. For quite a number of events this threshold is even distinct lower. As already mentioned above, these data are important for more accurate localizations of earthquakes with epicenters not too far away from Neumayer, e.g. the seismically active areas in the Southern Atlantic Ocean, ranging from the Antarctic Peninsula to the Bouvet Island triple junction and further eastwards.

Figure 5b shows the relationship between the focal depths and the directions (backazimuth) to the epicentres.

## The Seismological Network at Neumayer Station

- 1-Hz Seismometer (Le-3D/1s, vertical component only)
- 3-Component -Seismometer  
(Eigenperiods: 1 sec in the Observatory,  
5 and 20 sec's at the stations "Watzmann" and "Olymp")

Fig. 1 - Map of the Ekström Ice Shelf and the surrounding ice rises *Halvfar Ryggen* and *Soråsen* showing the remote stations of the seismological network around Neumayer (modified map based on the satellite image map from the *Institut für Angewandte Geodäsie*, 1989).

## The Geophysical Observatory at Neumayer Station

### Basic Instrumentation and Network Configuration

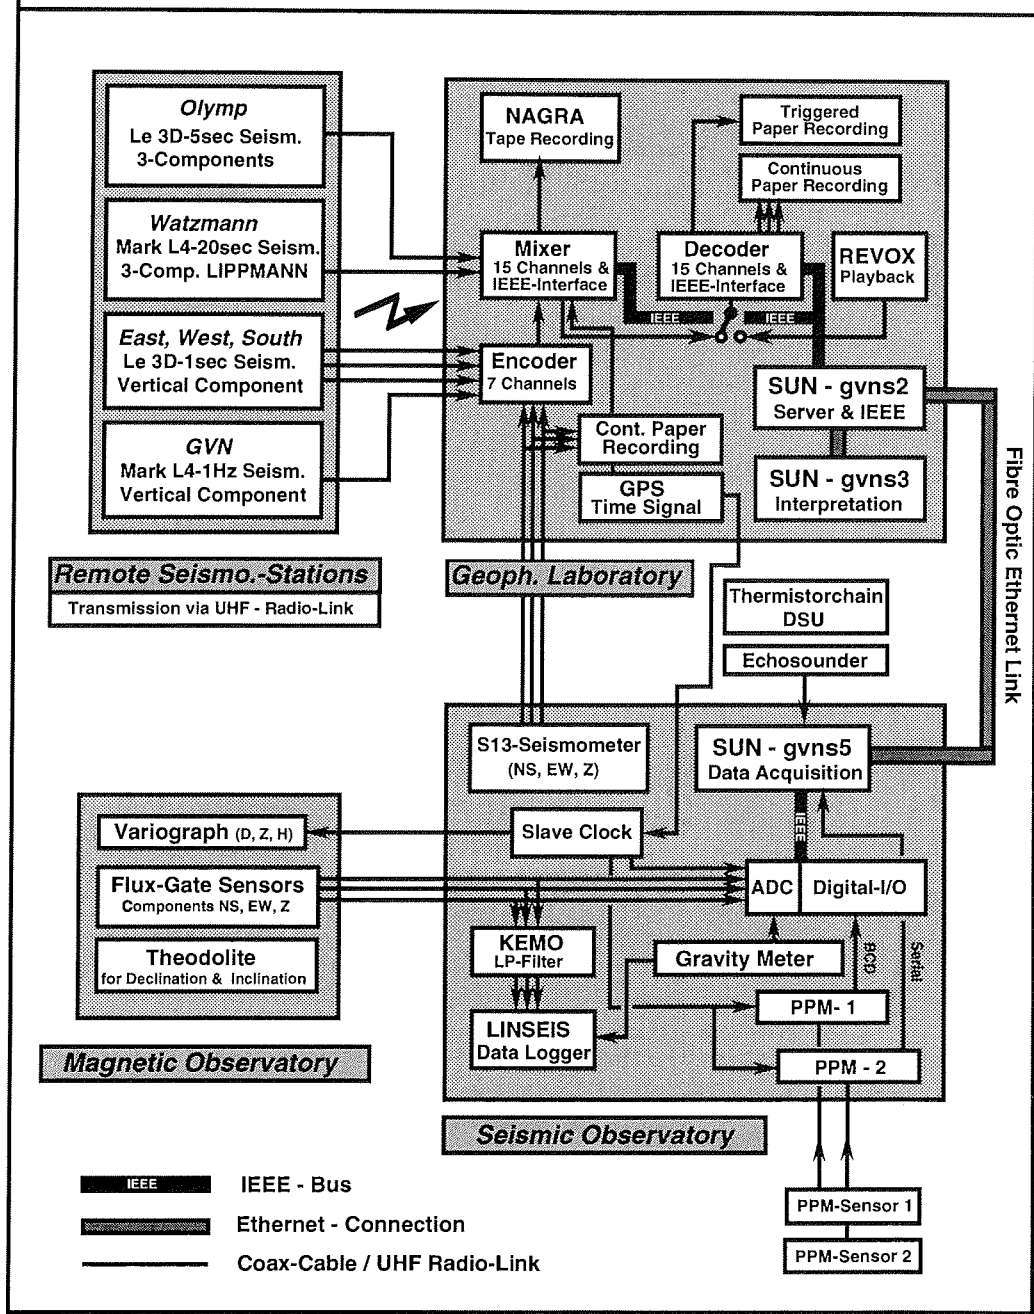

Fig. 2 - Block diagram of the principal configuration of the Geophysical Observatory at Neumayer Station.

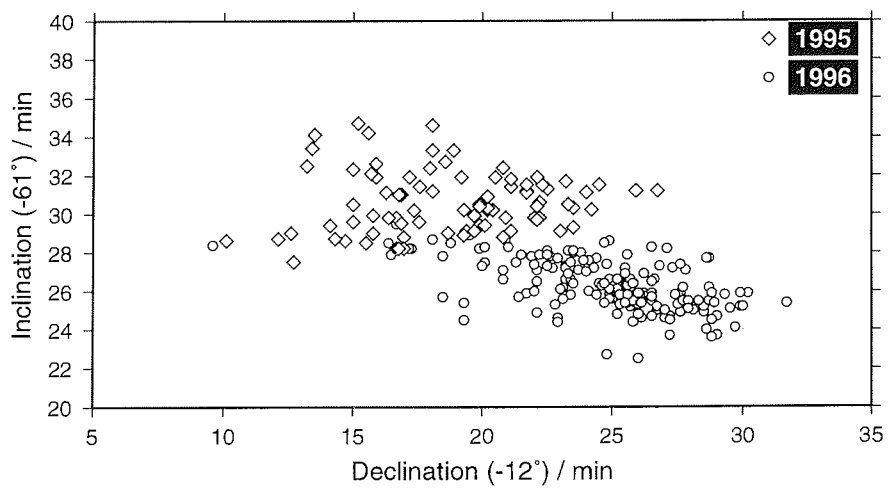

Fig. 3 - Time variations of the values for declination and inclination derived from D/I measurements to obtain the baselines for the components of the geomagnetic field. This plot clearly shows the influence of the secular variation onto the field's direction.

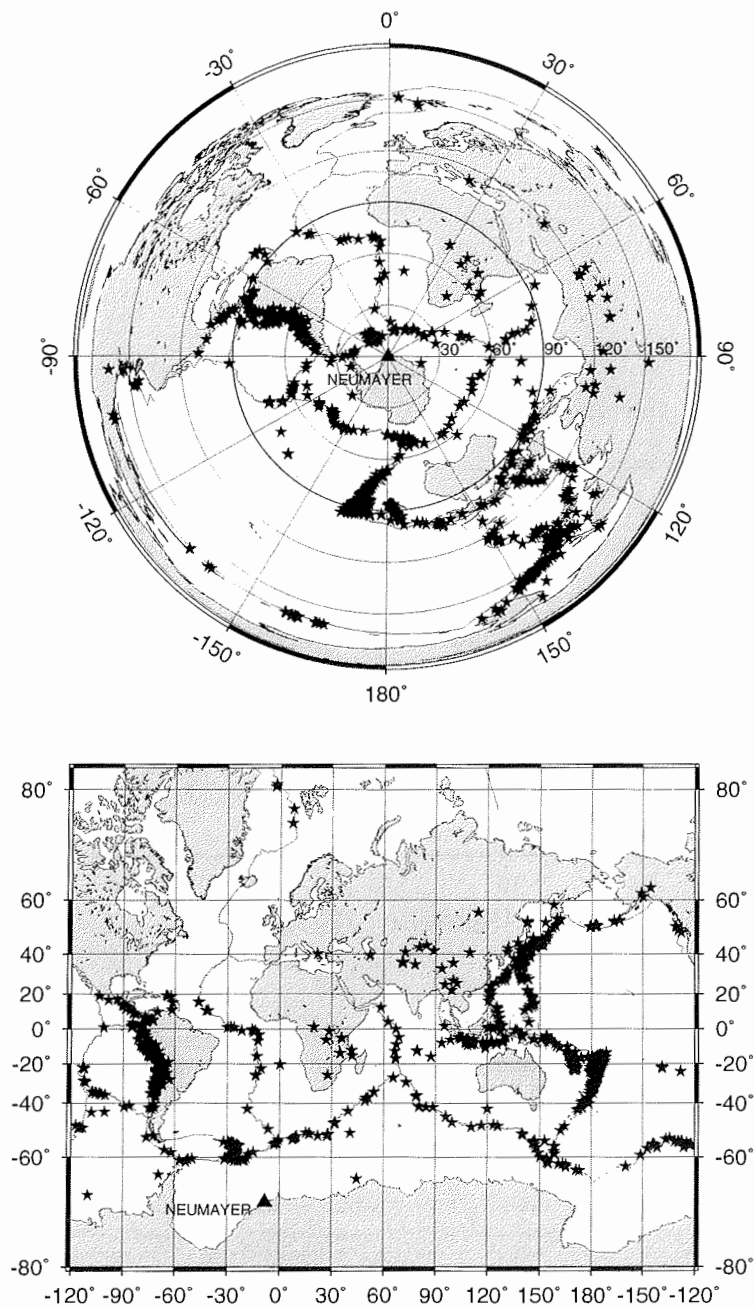

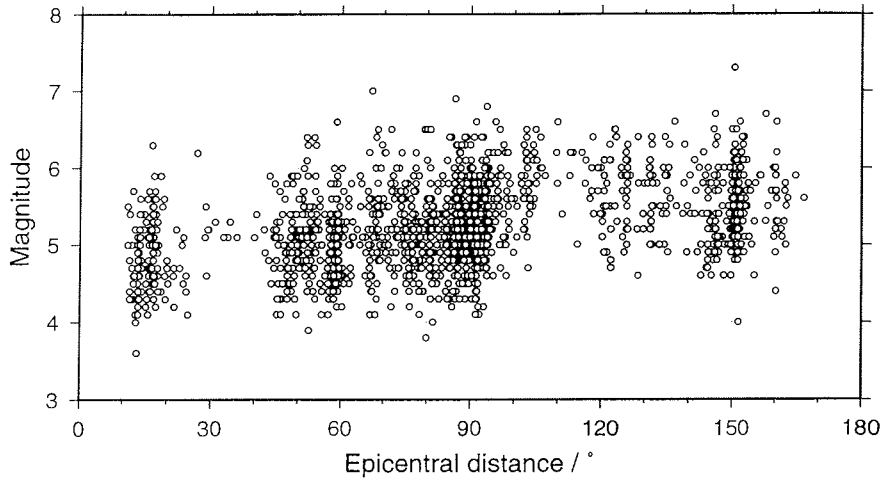

Fig. 4 - Locations of all 1292 events recorded in the years 1995 and 1996. The epicentres are plotted onto the earth's surface in two different kinds of projections:  
 The first diagram above shows the directional distribution of the events around Neumayer (Backazimuth). Negative values between 0° and -180° have to be added to 360° to get the right backazimuth (e.g. -30° corresponds to a backazimuth of 320°).  
 The second diagram on the bottom shows the latitude and longitude of the epicentres.

Neumayer Station 01/01/95-31/12/96 1292 events

Neumayer Station 01/01/95-31/12/96 1292 events

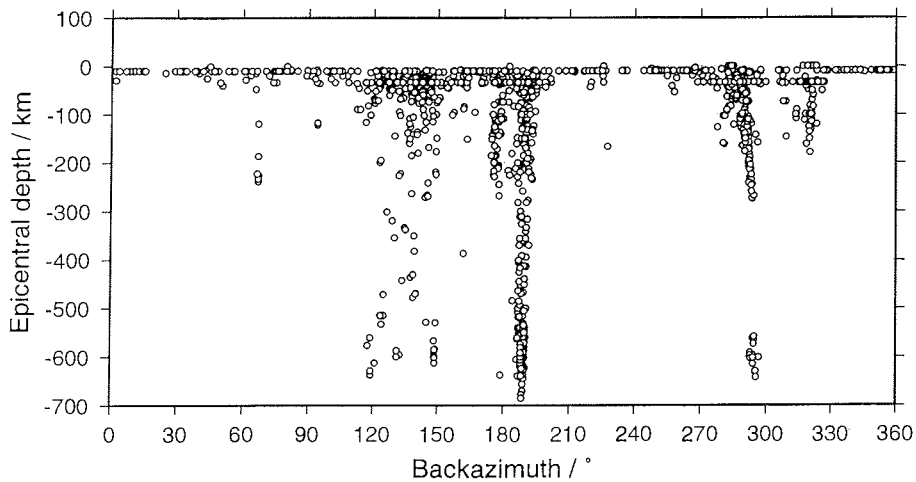

Fig. 5 - Magnitudes and Focus depths of all events recorded in 1995 and 1996:

(5a) The first diagram above shows the relationship between Magnitude and epicentral distance. The threshold-magnitudes of detection in the ranges up to  $100^\circ$  are in most cases lower than  $m_b = 5.0$ .

(5b) The second diagram on the bottom shows the relationship between focal depths and backazimuth. One can recognize quite good different focal depth distributions for events at backazimuths of  $180-200^\circ$  (Fiji-Tonga-Kermadec),  $280^\circ-290^\circ$  (South-America, Andes) and  $320^\circ$  (South Sandwich Islands Region).

## Folgende Hefte der Reihe „Berichte zur Polarforschung“ sind bisher erschienen:

- \* **Sonderheft Nr. 1/1981** – „Die Antarktis und ihr Lebensraum“,  
Eine Einführung für Besucher – Herausgegeben im Auftrag von SCAR
- Heft Nr. 1/1982** – „Die Filchner-Schelfeis-Expedition 1980/81“,  
zusammengestellt von Heinz Kohnen
- \* **Heft Nr. 2/1982** – „Deutsche Antarktis-Expedition 1980/81 mit FS 'Meteor'“,  
First International BIOMASS Experiment (FIBEX) – Liste der Zooplankton- und Mikronektonnetzfüge  
zusammengestellt von Norbert Klages
- Heft Nr. 3/1982** – „Digitale und analoge Krill-Echolot-Rohdatenerfassung an Bord des Forschungs-  
schiffes 'Meteor'“ (im Rahmen von FIBEX 1980/81, Fahrtabschnitt ANT III), von Bodo Morgenstern
- Heft Nr. 4/1982** – „Filchner-Schelfeis-Expedition 1980/81“,  
Liste der Planktonfänge und Lichtstärkemessungen  
zusammengestellt von Gerd Hubold und H. Eberhard Drescher
- \* **Heft Nr. 5/1982** – „Joint Biological Expedition on RRS 'John Biscoe', February 1982“,  
by G. Hempel and R. B. Heywood
- \* **Heft Nr. 6/1982** – „Antarktis-Expedition 1981/82 (Unternehmen 'Eiswarte')“,  
zusammengestellt von Gode Gravenhorst
- Heft Nr. 7/1982** – „Marin-Biologisches Begleitprogramm zur Standorterkundung 1979/80 mit MS 'Polarsirkel'  
(Pre-Site Survey)“ – Stationslisten der Mikronekton- und Zooplanktonfänge sowie der Bodenfischerei  
zusammengestellt von R. Schneppenheim
- Heft Nr. 8/1983** – „The Post-Fibex Data Interpretation Workshop“,  
by D. L. Cram and J.-C. Freytag with the collaboration of J. W. Schmidt, M. Mall, R. Kresse, T. Schwinghammer
- \* **Heft Nr. 9/1983** – „Distribution of some groups of zooplankton in the inner Weddell Sea in summer 1979/80“,  
by I. Hempel, G. Hubold, B. Kaczmaruk, R. Keller, R. Weigmann-Haass
- Heft Nr. 10/1983** – „Fluor im antarktischen Ökosystem“ – DFG-Symposium November 1982  
zusammengestellt von Dieter Adelung
- Heft Nr. 11/1983** – „Joint Biological Expedition on RRS 'John Biscoe', February 1982 (II)“,  
Data of micronekton and zooplankton hauls, by Uwe Piatkowski
- Heft Nr. 12/1983** – „Das biologische Programm der ANTARKTIS-I-Expedition 1983 mit FS 'Polarstern'“,  
Stationslisten der Plankton-, Benthos- und Grundscheppnetzfüge und Liste der Probennahme an Robben  
und Vögeln, von H. E. Drescher, G. Hubold, U. Piatkowski, J. Plötz und J. Voß
- \* **Heft Nr. 13/1983** – „Die Antarktis-Expedition von MS 'Polarbjörn' 1982/83“ (Sommerkampagne zur  
Atka-Bucht und zu den Kraul-Bergen), zusammengestellt von Heinz Kohnen
- \* **Sonderheft Nr. 2/1983** – „Die erste Antarktis-Expedition von FS 'Polarstern' (Kapstadt, 20. Januar 1983 –  
Rio de Janeiro, 25. März 1983)“, Bericht des Fahrtleiters Prof. Dr. Gotthilf Hempel
- Sonderheft Nr. 3/1983** – „Sicherheit und Überleben bei Polarexpeditionen“,  
zusammengestellt von Heinz Kohnen
- \* **Heft Nr. 14/1983** – „Die erste Antarktis-Expedition (ANTARKTIS I) von FS 'Polarstern' 1982/83“,  
herausgegeben von Gotthilf Hempel
- Sonderheft Nr. 4/1983** – „On the Biology of Krill *Euphausia superba*“ – Proceedings of the Seminar  
and Report of the Krill Ecology Group, Bremerhaven 12.-16. May 1983, edited by S. B. Schnack
- Heft Nr. 15/1983** – „German Antarctic Expedition 1980/81 with FRV 'Walther Herwig' and RV 'Meteor'“ –  
First International BIOMASS Experiment (FIBEX) – Data of micronekton and zooplankton hauls  
by Uwe Piatkowski and Norbert Klages
- Sonderheft Nr. 5/1984** – „The observatories of the Georg von Neumayer Station“, by Ernst Augstein
- Heft Nr. 16/1984** – „FIBEX cruise zooplankton data“,  
by U. Piatkowski, I. Hempel and S. Rakusa-Suszczewski
- Heft Nr. 17/1984** – „Fahrtbericht (cruise report) der 'Polarstern'-Reise ARKTIS I, 1983“,  
von E. Augstein, G. Hempel und J. Thiede
- Heft Nr. 18/1984** – „Die Expedition ANTARKTIS II mit FS 'Polarstern' 1983/84“,  
Bericht von den Fahrtabschnitten 1, 2 und 3, herausgegeben von D. Fütterer
- Heft Nr. 19/1984** – „Die Expedition ANTARKTIS II mit FS 'Polarstern' 1983/84“,  
Bericht vom Fahrtabschnitt 4, Punta Arenas-Kapstadt (Ant-II/4), herausgegeben von H. Kohnen
- Heft Nr. 20/1984** – „Die Expedition ARKTIS II des FS 'Polarstern' 1984, mit Beiträgen des FS 'Valdivia'  
und des Forschungsflugzeuges 'Falcon 20' zum Marginal Ice Zone Experiment 1984 (MIZEX)“,  
von E. Augstein, G. Hempel, J. Schwarz, J. Thiede und W. Weigel
- Heft Nr. 21/1985** – „Euphausiid larvae in plankton samples from the vicinity of the Antarctic Peninsula,  
February 1982“, by Sigrid Marschall and Elke Mizdalski
