EP3-94-MB
NOAA Ship Malcolm Baldrige
Rodman, Panama – San Diego
August 4 – 27, 1994

Chief Scientist: L. Mangum
Survey Department: CST Sweeney, Lamire, Zaragoza
CTD Personnel: L. Mangum
Final Processing: M. Swapp and K. McTaggart

ACQUISITION:

A total of 26 CTD casts were taken along 95W and 110W during leg 1
of the fall EPOCS cruise using PMEL Neil Brown CTD s/n 1114 and
12-bottle rosette sampling package. The majority of casts were to a
depth of 1000 meters. Typically 12 bottles were fired on each cast and
salinity samples were taken for calibration checks of the NBIS CTD.
Survey department personnel under the supervision of Linda Mangum were
responsible for preparing the CTD, all data acquisition, collection of
water samples, and analyzing the samples for salinity using the ship's
Autosal.

The CTD data were acquired using the ship's LOGGER software. Audio
backups were made on VCR tapes. Raw CTD data were transferred from the
acquisition microVAX to the processing microVAX where PMEL programs
reduced the data for analysis. Final calibrations were determined at
PMEL after the cruise.

Cast 11 was aborted because the printouts showed the rosette firing
bottles during the downcast.

CONDUCTIVITY CALIBRATIONS:

CALIB.DAT precruise calibrations for PMEL CTD 1114:

```
1114    6  380
-0.13418  0.9992288  0.398032E-7   0.143853E-10    P DN  S/N 1114  JUL 94
-0.82380  0.9979059  0.523471E-6  -0.285092E-10    P UP  S/N 1114  JUL 94
-0.00301  1.0001160  0.000000E-6   0.000000E-10    T 68  S/N 1114  JUL 94
-0.00558  1.0001040  0.000000E-6   0.000000E-10    C     S/N 1112  JUL 94
```

Post-cruise, files were restored to the VAX computer system at PMEL
from Exabyte 8mm tapes. The .CAL file was created on the ship using
CALDSK which takes the CTD values from those written on the cast logs
during acquisition and not from the READER listings. The .CAL file
was proofed, typos corrected, and put into the latest format compatible
with WOCE modified programs at the lab. LINCALW.FOR, CALMSTRW.FOR,
CALMCONW.PPC, and CALMDEEPW.PPC were used to find the best calibrations
to apply to this data set.

Final calibrations applied were from an overall fit of all bottles
(casts 1 and 2 collected no samples owing to a rosette error):

$$A0 = -0.5760980E-03$$
$$A1 = 0.9977739E+00$$
max residual = -0.0254
std error = 0.0102 (6/197 discarded in 3 reps)

CONDUCTIVITY CALIBRATION PROGRAMS & PPLUS COMMAND FILES:

```
CALDSKW - creates .CAL uncalibrated data file on SCS system
CALMSTRW - inputs .CAL uncalibrated data file
         - outputs .CLB calibrated data file (from .COM), and
           .SEA calibrated WOCE data file (edit quality bytes)
LINCALW - inputs .CAL uncalibrated data file (may be broken into
          groups), applies a linear fit to the data and throws out
          any points greater than 2.8 times the standard deviation,
          iterates through the program until no points are thrown out
        outputs .COEF file containing linear fit coefficients and
        .LOG file of fit iterations
CALMCONW.PPC - reads .CLB calibrated bottle data file and makes five
               separate scatter plots: P, T, C, S, and cast number vs.
               delta-C (CTD-bottle).  These are examined for cast
               breaks and drifts in the CTD.
CALMDEEPW.PPC - reads .CLB calibrated bottle data file and makes two
                separate scatter plots: CTD salinity and bottle salinity
                vs. potential temperature from theta=0.6 to 2.2 C.
DEEPCTD.PPC - reads .CTD EPIC pointer file and .BOT EPIC pointer file
              of deep casts only and overplots the bottle salinity
              data and CTD salintiy trace from theta=.8 to 2.4 C for
              each deep cast.
```

PROCESSING:

Raw data files were restored from Exabyte 8mm tapes to the VAX at PMEL.
Standard processing programs for the Baldrige with default parameters
were used to reduce these data.

Post-cruise calibrations included 1) an overall linear fit applied to all
casts. 2) Salinity offsets were determined using deep (i.e. 1000 db)
theta-S plots and applied using program EPCTDW_OFF:

```
        if (ncast.eq.001) soffset = 0.025
        if (ncast.eq.002) soffset = 0.025
        if (ncast.eq.003) soffset = 0.025
        if (ncast.eq.004) soffset = -.015
        if (ncast.eq.006) soffset = 0.024
        if (ncast.eq.007) soffset = 0.024
        if (ncast.eq.009) soffset = 0.008
        if (ncast.eq.010) soffset = 0.008
        if (ncast.eq.012) soffset = 0.002
        if (ncast.eq.013) soffset = -.021
        if (ncast.eq.014) soffset = -.021
        if (ncast.eq.015) soffset = 0.016
        if (ncast.eq.016) soffset = 0.025
        if (ncast.eq.017) soffset = -.025
        if (ncast.eq.018) soffset = -.010
        if (ncast.eq.019) soffset = 0.005
        if (ncast.eq.020) soffset = 0.029
        if (ncast.eq.021) soffset = 0.005
        if (ncast.eq.022) soffset = 0.003
        if (ncast.eq.023) soffset = 0.012
        if (ncast.eq.024) soffset = -.020
        if (ncast.eq.026) soffset = 0.010
     DATA(3,L)=SAL78(C/42.914,DATA(2,L),DATA(1,L),0)
     data(3,l)=data(3,l) + soffset
```

Cruise bottle data were compared to and fell within historical bottle data
for each line. 3) As a check of the final calibrations, salinity profiles
were overplotted line by line.

Final CTD and bottle files were moved to DISK$HAYES and included in the RIM data management tables on December 18, 1995.

DPDNB - inputs EG&G .EDT raw data file
      - outputs .DPZ binary file including computed fall rates and .RECZ ASCII file to choose downcast record range from
DLAGB - inputs .DPZ binary file, applies precruise calibrations from CALIB.DAT, edits data for window outliers (according to WINDOW.DAT) and first differencing outliers, fills gaps by linear interpolation, lags conductivity, edits data exceeding fall rate criteria (according to .INP created by DLAGAVZ.COM; default minimum fall rate acceptable is .8 db/60 scans (25 meters per minute) and pressure interval of 1.5 db; doesn't fill these gaps), computes 1-meter averages, and applies cell dependence to final conductivity values
      - outputs CTDERR.DAT file of outlier flags, interpolated values, and fall rate criteria failures, and an ASCII .CTD data file including computed salinity
EPCTDW - inputs .CTD calibrated P, T, OXC, OXT, and raw conductivity; applies any additional P and T cals (in EPCTDW_SHIP.COM), corrects raw C for cell factor, and applies C cals from EPCTDW_SHIP.COM; computes salinity; deals with oxygen if there was a sensor; option to eliminate 1-point spikes according to the gradients hardwired into the source code NOT used by default; omits any values for manual despiking; fills by linear interpolation for a value to exist every whole meter; recomputes C from S; and calculates other EPIC variables.
      - outputs final .CTD data file in EPIC format, and a .LOG file listing editted and filled data points
EPICBOMSTRW - inputs .CLB calibrated bottle data file and .CTD EPIC data files (for header information)
      - outputs .BOT bottle data files in EPIC format
TSPLTEP.PPC - reads .CTD EPIC pointer file and .BOT EPIC pointer file and overplots full water column bottle salinity and CTD trace as well as sigma-t lines (from SIGMAT.DAT). Use TSPLTB.PPC to include oxygen data.
TEXTNOX - inputs .CTD EPIC pointer file and constructs PPLUS subcommand files
      - outputs TXT*.PPC files containing %label commands for table listings for each cast
3PLTNOX.PPC - reads TXT*.PPC subcommand files and .CTD EPIC pointer file and overplots vertical profiles of temperature, salinity, and sigma-t vs. pressure to 1000 db on left-hand side of page; and lists data in table form on right-hand side of page. Use 4PLT1DB.PPC to include oxygen data.
