# 1 Hardware installation

## 1.1 Safety information

It is urgently required to take the following safety information in account:

Disregard of the safety information can cause damages of the hardware and leads to loss of the right to claim under guarantee.

## 1.2 Placement of the Scanner

**Caution!** Avoid physical shocks and pay attention to avoid mechanical damage to the camera housing.

You either have the possibility to operate the scanner horizontally or to mount it with the help of the nuts in the aluminum profiles to a wall. In case of the wall mounting, the connectors of the scanner should show to the right side. If the connectors show upwards or downwards, it might lead to problems during the operation.

Place the scanner as central as possible in the x-ray beam. The objects which should be inspected are placed for the imaging onto the carbon fibre plate. So the carbon fibre plate must be irradiated from the x-ray source (see Figure 2).

### 1.3 Connection the scanner

**Important:** Please note the safety information in chapter 1.1!

The enclosed scanner cable transmits the control signals and the image information between the scanner and the PC. Make sure, that the mains appliance for the scanner and the PC are turned off. Then connect one side of the cable with the plug at the scanner. On the rear side of the PC you find a plug which is lettered with "Scanner". Connect the other side of the cable with this plug.

### 1.4 Power supply

**Important:** Please note the safety information in chapter 1.1!

The scanner needs an additional power supply for the operation. Make sure, that the mains appliance for the scanner and the PC are turned off. Then connect the nine channel plug of the mains appliance with the scanner, connect the mains appliance to the mains and turn the mains appliance on.

### 1.5 Using the ribbon cables

If the scanner is used in a cabinet without access port, or the access port of the cabinet is too small, the ribbon cables can be passed under the cabinet's door to connect the scanner.

Please note that the use of the ribbon cables are only optional. If required, they can be used, but it is not necessary to use them.
