

Arctic Nearshore Sediment Dynamics

from High-Resolution Phase Measuring Bathymetric Sonar Data:
bathymetry, backscatter imagery, and seabed classification

Study Area

Rationale

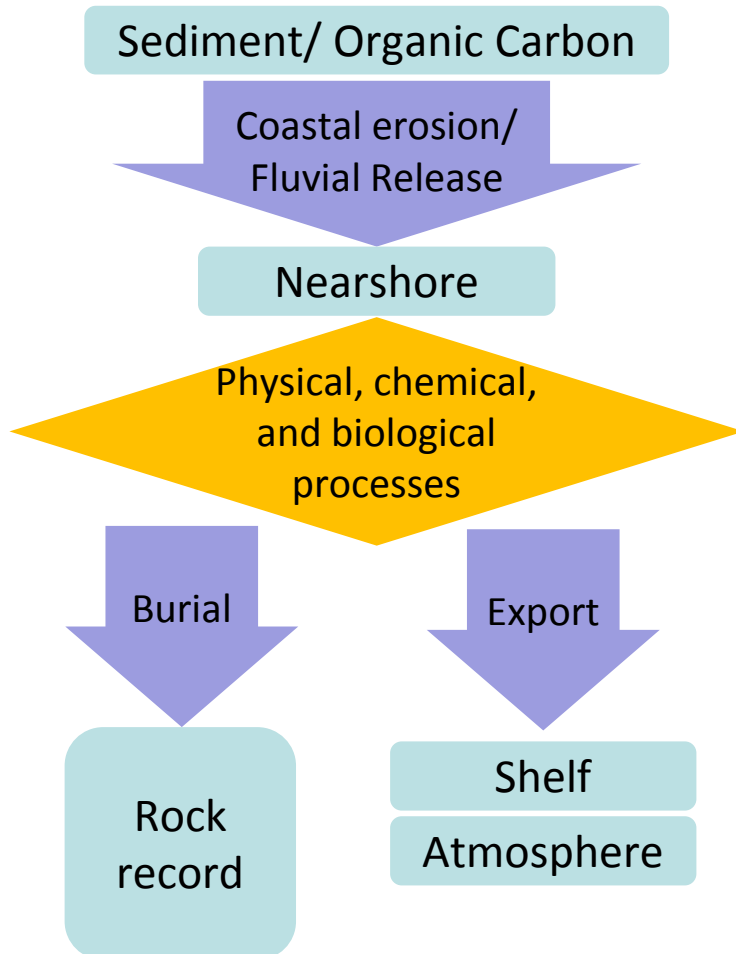

COPER

Coastal Permafrost Erosion (and carbon release)

Carbon and sediment transport in the nearshore zone

Objectives

- Establish a baseline dataset to
 - Assess intensity of physical processes (e.g. ice scour)
 - Map sediment distribution
 - Assess volumetric change along the coastal tract
 - Investigate influence of seafloor geomorphology on erosion
 - Quantify carbon sequestration

Methods

- Collect bathymetry and sidescan imagery
- Process
 - Bathymetry: GS+
 - Backscatter: GeoTexture (process, mosaic, classify)
- VanVeen benthic grabs
- Validate classification

Experimental setup

Kongsberg GeoSwath Plus Compact

- phase measuring bathymetric sonar
- 240° view angle
- Frequency: 500 kHz
- MRU: IXSEA Octans 3000
- RTK GPS (Trimble R4)

Experimental setup

- RV Christine

Experimental setup

Bathymetry

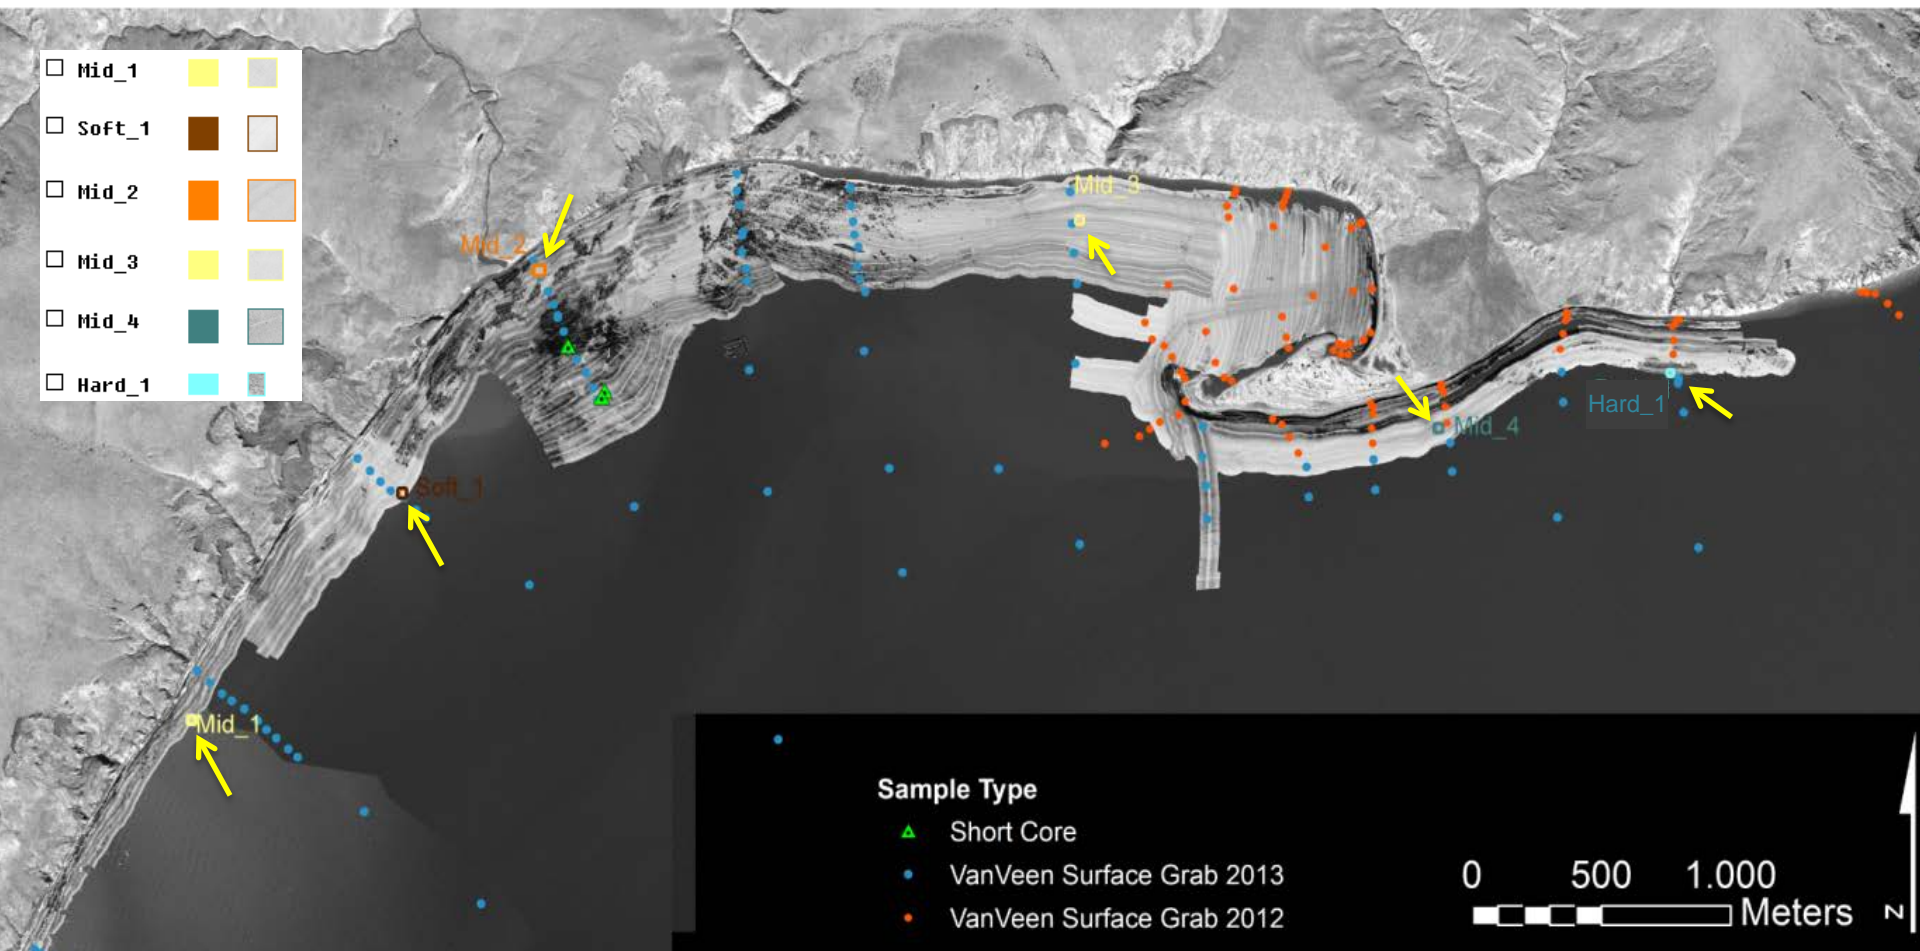

Herschel
Island

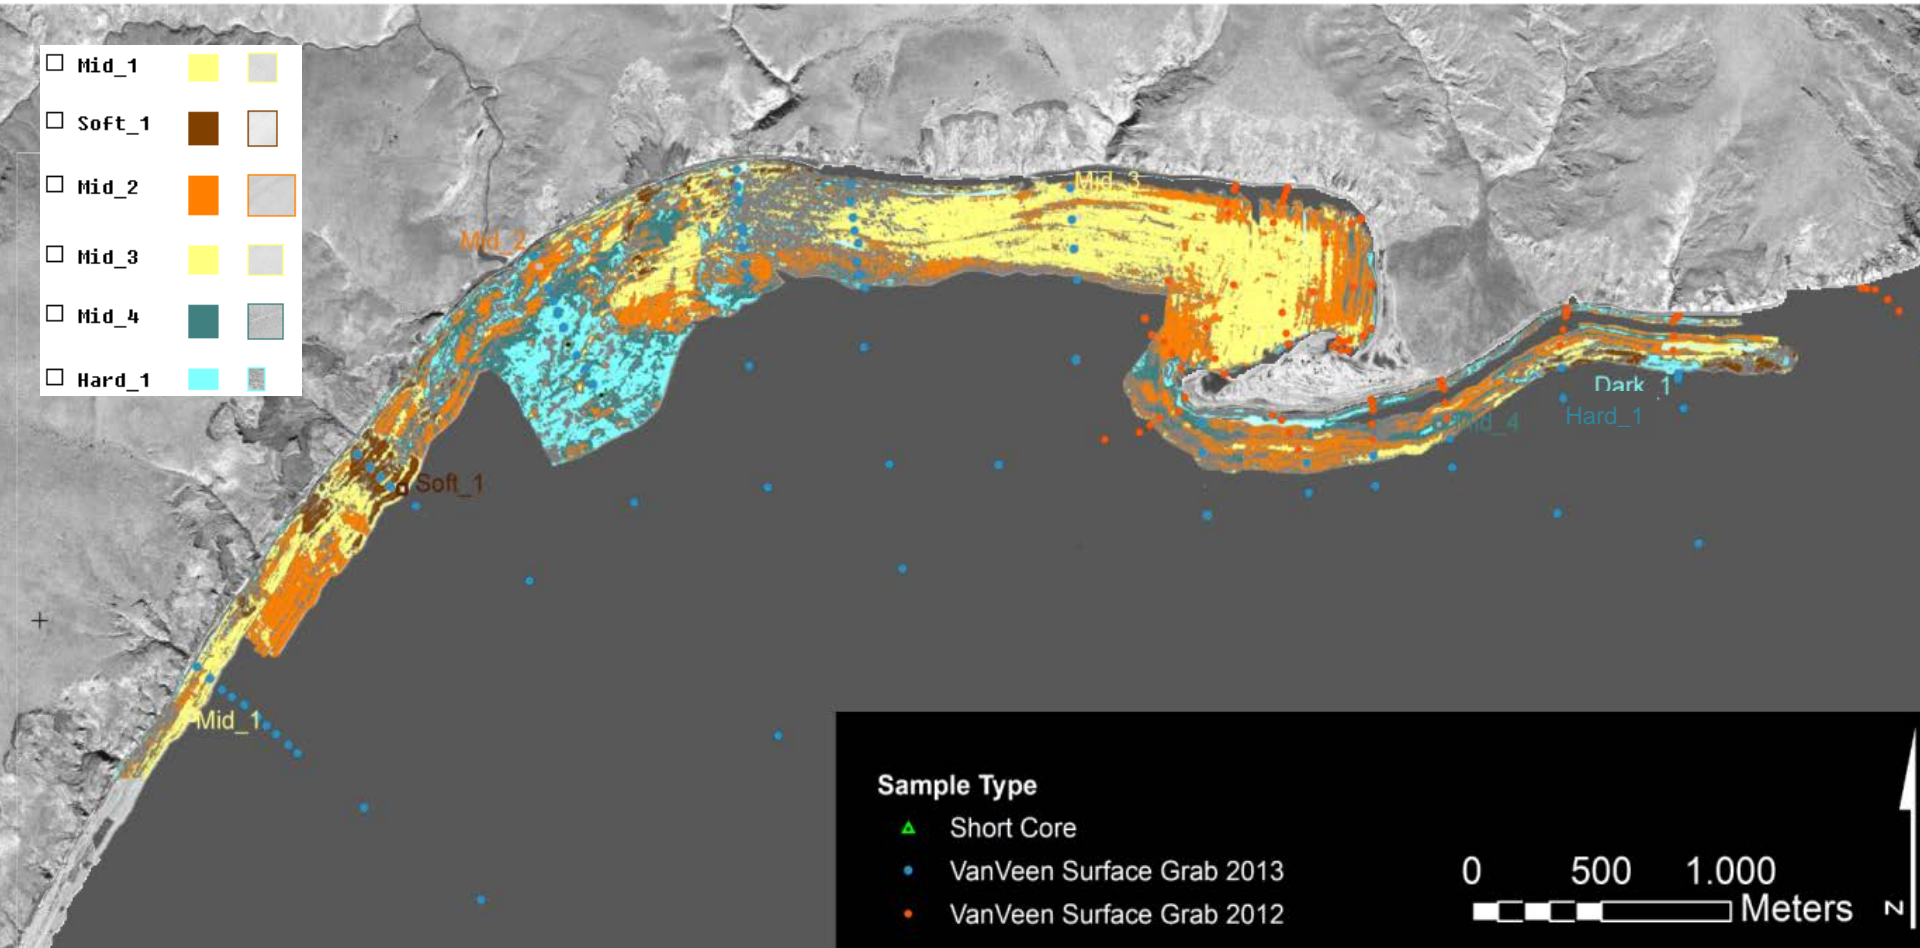

Classification and Validation

- normalised SMO mosaic

Selection of textures

Probability matrix

	Mid_1 0	Soft_1 1	Mid_2 2	Mid_3 3	Mid_4 4	Hard_1 5
0	0.928	0	0	0.174	0	0
1	0	0.999	0	0.001	0	0
2	0	0	1	0	0	0
3	0.071	0.001	0	0.825	0	0
4	0	0	0	0	0.956	0.007
5	0	0	0	0	0.044	0.993

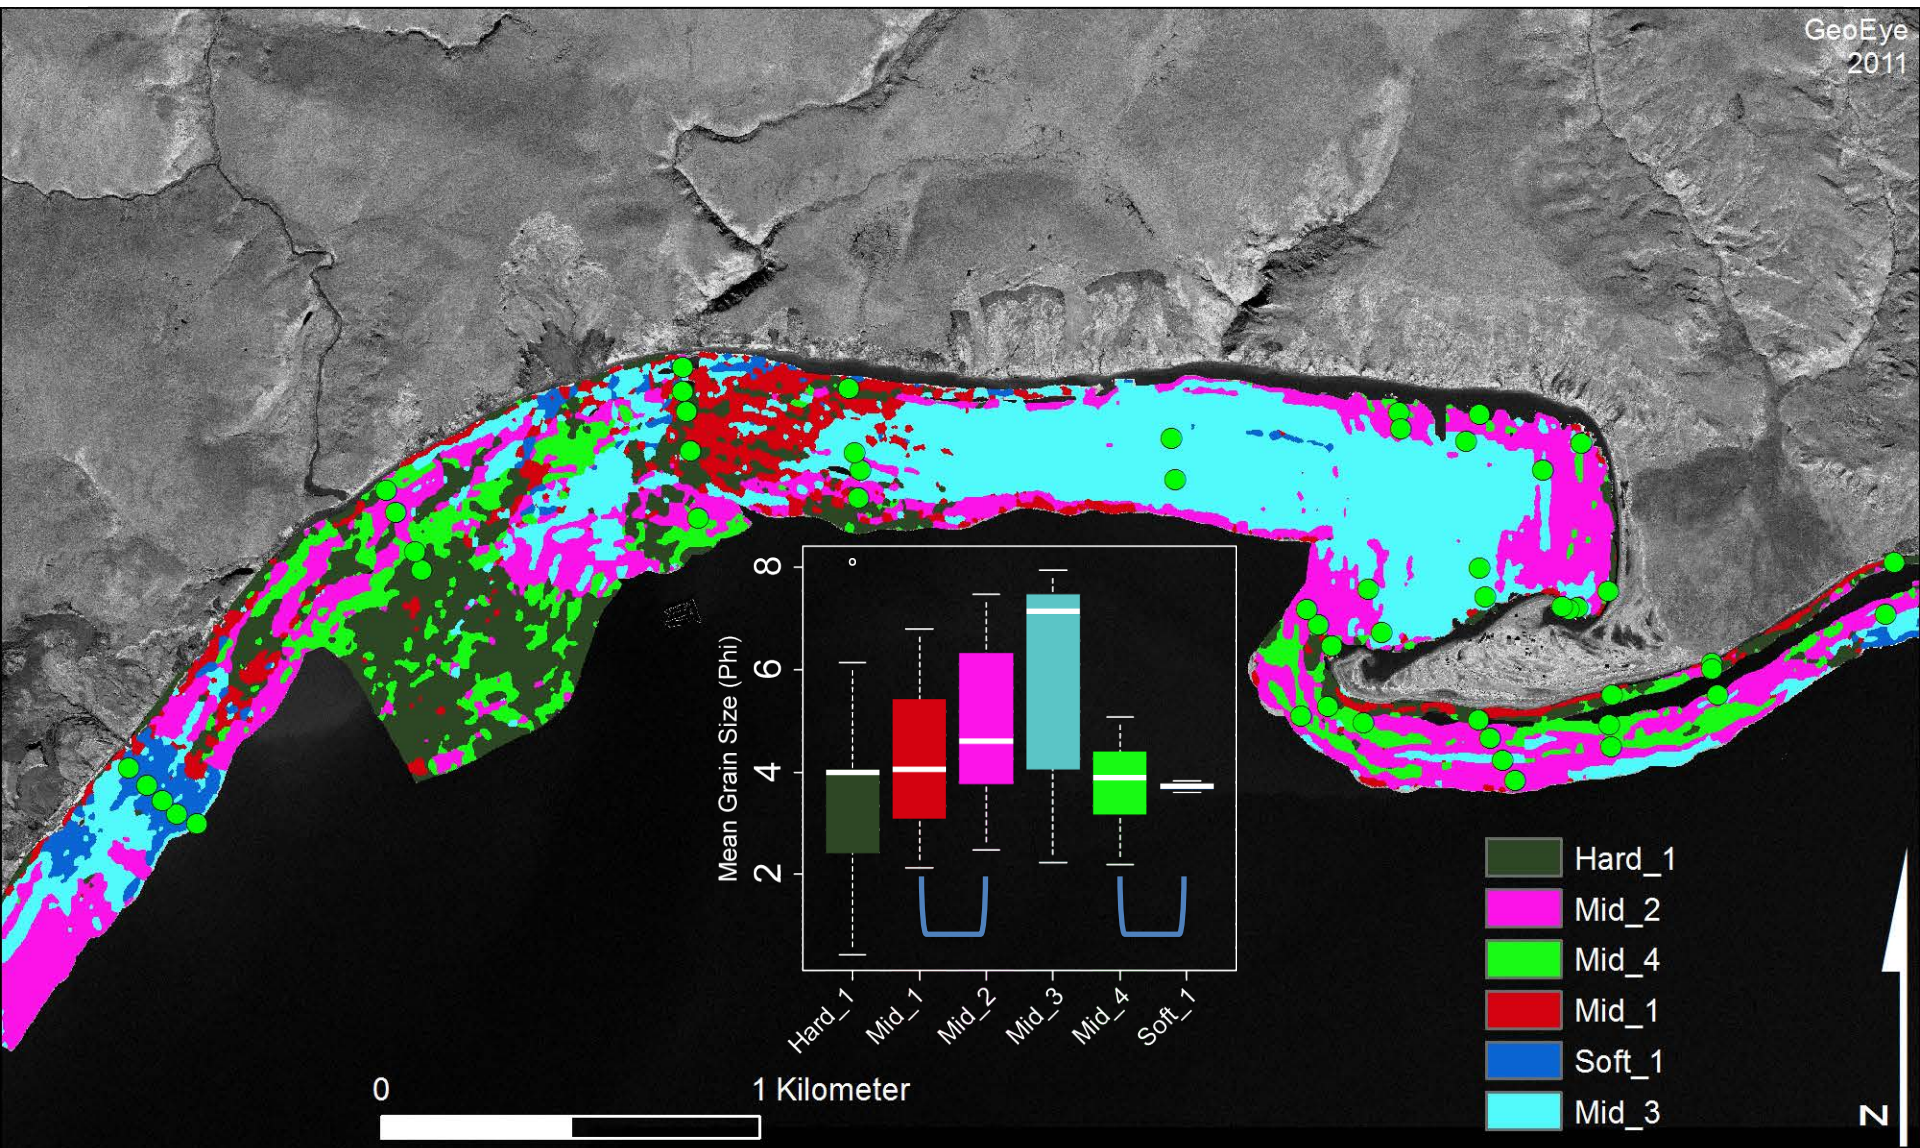

Separation matrix

	Mid_1 0	Soft_1 1	Mid_2 2	Mid_3 3	Mid_4 4	Hard_1 5
0	0	6.4	6	2.7	10.1	7

Sediment Data

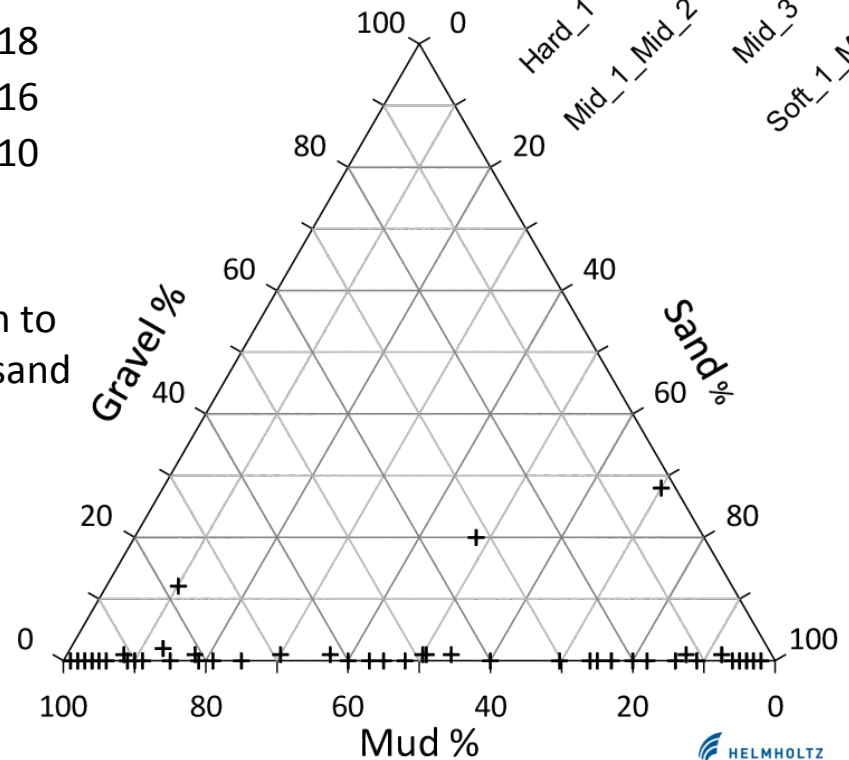

ANOVA	Df	Sum Sq	Mean Sq	F Value	Pr(>F)
CombinedClasses	3	50.09	16.697	5.422	0.00254
Residuals	52	160.12	3.079		

CombinedClasses	mean	sd	data:n
Hard_1	3.694	2.0029635	12
Mid_1_Mid_2	4.844	1.7382992	18
Mid_3	6.037	1.9713133	16
Soft_1_Mid_4	3.747	0.8388623	10

Texture	clay	silt	fine sand	medium to coarse sand
Hard_1	1	4	5	2
Mid_1_Mid_2	0	11	7	0
Mid_3	0	13	3	0
Soft_1_Mid_4	0	3	7	0

Conclusions

- GeoTexture is a valuable tool for classifying bottom textures
- Strongly dependent on user input
- Need more data to validate, although results very promising
- Get better data next time
- Find the easy button!

Thanks!
